

Feather Duster

Colored Feather Dusters are soft-bodied segmented worms which excrete a mucous layer which collects mud and sand creating a fibrous sheath. Their feathery crown may be colored yellow-green or reddish brown, and serves as a net to gather fine particulate food out of the water column. They are easy to maintain and prefer a fine substrate environment.

Feather dusters are ideal for beginners and are also sought after by experienced aquarists because of their beauty and simplicity. If cared for correctly a feather duster will give you years of enjoyment.

This particular filter feeder is smaller than their Hawaiian cousins. Their crowns are typically shades of white, red or green but are found in other color variations. If color is important please notify the ordering department to find out what is available.

SPECIFIC GRAVITY RANGE	1.022-1.025
MAXIMUM SIZE	2" (crown)
TEMPERATURE RANGE	75-82
PH RANGE	8.0-8.4
SCIENTIFIC NAME	Bispira sp.
COMMON NAME	Colored Feather Duster - Small
DIFFICULTY	Easy
DIET	Filter-feeder
ORIGIN	Indo-Pacific
INVERT SAFE	Yes
REEF SAFE	Yes
RESTRICTED	Yes
